AMENDMENTS TO THE CLAIMS

1. (Original) An encryption code management system for use in a plurality of communication systems composed of a plurality of data processors that exchange data encrypted with specific encryption codes,

wherein there is provided an electronic apparatus including:

a code management reception portion that receives the encryption codes of the data processors;

a code management control portion that compares a plurality of the encryption codes received by the code management reception portion; and

a result output portion that outputs a comparison result yielded by the code management control portion, and

wherein the data processors include a code management transmission portion that transmits the encryption codes of the data processors themselves to the electronic apparatus.

2. (Original) The encryption code management system of claim 1, wherein the data processors include an encryption portion that encrypts a signal transmitted from the code management transmission portion to the electronic apparatus.

3. (Original) The encryption code management system of claim 2, wherein the electronic apparatus includes a decryption portion that decrypts the signal received by the code management reception portion from the data processors.

4. (Original) The encryption code management system of claim 2, wherein an encryption key to be used to encrypt the encryption codes is transmitted from a side that receives the encryption codes and the comparison result.

5. (Original) The encryption code management system of claim 4, wherein the encryption key used for encryption in the data processors is transmitted along with a code request signal transmitted by the electronic apparatus to request the data processors to transmit the encryption codes.

6. (Original) The encryption code management system of claim 2, wherein an encryption key having been used to encrypt the encryption codes is transmitted, along with the encryption codes and the comparison result, from a side that transmits the encryption codes.

7. (Original) The encryption code management system of claim 1,

wherein the electronic apparatus includes a code storage portion that stores one or a plurality of the encryption codes received, and

wherein the electronic apparatus

first receives, via the code management reception portion, the encryption codes from the data processors and then stores the received encryption codes in the code storage portion,

then receives, via the code management reception portion, the encryption codes from the data processors other than those corresponding to the encryption codes stored in the code storage portion, and

then compares, in the code management control portion, the encryption codes received by the code management reception portion with the encryption codes stored in the code storage portion to search for coincidence, and then yields a search result as the comparison result.

8. (Original) The encryption code management system of claim 7, wherein, when the electronic apparatus recognizes that a predetermined period of time has passed after the encryption codes were stored in the code storage portion, the electronic apparatus erases the encryption codes from the code storage portion.

9. (Original) The encryption code management system of claim 7, wherein, when the electronic apparatus recognizes that coincidence with the encryption codes stored in the code storage portion has been found more than a predetermined number of times, the electronic apparatus erases the encryption codes from the code storage portion.

10. (Original) The encryption code management system of claim 7, wherein the electronic apparatus includes an erasure operation portion that erases from the code storage portion the encryption codes stored therein.

11. (Original) The encryption code management system of claim 7,

wherein the electronic apparatus includes, one for each of the data processors with which the electronic apparatus has communicated, registration keys with which to register identification codes by which the data processors are identified, and

wherein the electronic apparatus stores in the code storage portion the encryption codes along with the identification codes registered with the registration keys.

12. (Original) The encryption code management system of claim 11, wherein, in the result output portion of the electronic apparatus or the data processors, the communication systems composed of a plurality of the data processors among which the encryption codes are coincident are indicated by displaying the identification codes thereof to indicate groups to which the plurality of data processors belong.

13. (Original) The encryption code management system of claim 11, wherein the identification codes are installation positions and types of the data processors.

14. (Original) The encryption code management system of claim 11, wherein the identification codes are device names of the data processors.

15. (Original) The encryption code management system of claim 1,

wherein the electronic apparatus includes a code storage portion that stores a plurality of the encryption codes received, and

wherein the electronic apparatus first receives, via the code management reception portion, the encryption codes of the plurality of the data processors and then stores the received encryption codes in the code storage portion, and

then compares, in the code management control portion, all the encryption codes stored in the code storage portion to confirm, as the comparison result, communication connection relationships between the data processors among which the encryption codes are coincident.

16. (Original) The encryption code management system of claim 15,

wherein the electronic apparatus

first receives, via the code management reception portion, the encryption codes from the data processors other than those corresponding to the plurality of the encryption codes stored in the code storage portion, and

then compares, in the code management control portion, the encryption codes received by the code management reception portion with the plurality of the encryption codes stored in the code storage portion to search for coincidence, and then yields a search result as the comparison result.

17. (Original) The encryption code management system of claim 1, wherein, in the result output portion of the data processors or the electronic apparatus, a plurality of the data processors among which the encryption codes are coincident and that thus build one communication system are displayed as one group.

18. (Original) The encryption code management system of claim 1 wherein, when the encryption codes are exchanged, the encryption codes are exchanged along with device names of the data processors with which the encryption codes are associated.

19. (Original) The encryption code management system of claim 1, wherein the electronic apparatus is a remote control unit for operating the data processors.

20. (Original) The encryption code management system of claim 1, wherein the data exchanged between the data processors is AV data.

21. (Original) An encryption code management system for use in a plurality of communication systems composed of a plurality of data processors that exchange data encrypted with specific encryption codes,

wherein there is provided an electronic apparatus including:

a code management reception portion that receives the encryption codes of the data processors;

a code management control portion that compares a plurality of the encryption codes received by the code management reception portion; and

a code management transmission portion that transmits a comparison result yielded by the code management control portion to the data processors, and

wherein the data processors include:

a code management transmission portion that transmits the encryption codes of the data processors themselves to the electronic apparatus;

a code management reception portion that receives the comparison result from the electronic apparatus; and

a result output portion that outputs the comparison result received by the code management reception portion.

22. (Original) The encryption code management system of claim 21,

wherein the data processors include:

an encryption portion that encrypts a signal to be transmitted from the code management transmission portion to the electronic apparatus; and

a decryption portion that decrypts a signal having received by the code management reception portion from the electronic apparatus, and

wherein the electronic apparatus includes:

an encryption portion that encrypts a signal to be transmitted from the code management transmission portion to the data processors; and

a decryption portion that decrypts a signal having received by the code management reception portion from the data processors.

23. (Original) The encryption code management system of claim 22, wherein an encryption key to be used to encrypt the encryption codes is transmitted from a side that receives the encryption codes and the comparison result.

24. (Original) The encryption code management system of claim 23, wherein the encryption key used for encryption in the data processors is transmitted along with a code request signal transmitted by the electronic apparatus to request the data processors to transmit the encryption codes.

25. (Original) The encryption code management system of claim 22, wherein an encryption key having been used to encrypt the encryption codes is transmitted, along with the encryption codes and the comparison result, from a side that transmits the encryption codes.

26. (Original) An encryption code management system for use in a plurality of communication systems composed of a plurality of data processors that exchange data encrypted with specific encryption codes,

wherein there is provided an electronic apparatus including:

a code management reception portion that receives the encryption codes of the data processors;

a code storage portion that stores one or a plurality of the encryption codes received by the code management reception portion; and

a code management transmission portion that transmits the encryption codes stored in the code storage portion to the data processors, and

wherein the data processors include:

a code management transmission portion that transmits the encryption codes of the data processors themselves to the electronic apparatus;

a code management reception portion that receives the encryption codes transmitted from the electronic apparatus;

a code management control portion that compares the encryption codes received by the code management reception portion with the encryption codes of the data processors themselves; and

a result output portion that outputs a comparison result yielded by the code management control portion.

27. (Original) The encryption code management system of claim 26, wherein, when the electronic apparatus recognizes that a predetermined period of time has passed after the encryption codes were stored in the code storage portion, the electronic apparatus erases the encryption codes from the code storage portion.

28. (Original) The encryption code management system of claim 26, wherein, when the electronic apparatus recognizes that coincidence with the encryption codes stored in the code storage portion has been found more than a predetermined number of times, the electronic apparatus erases the encryption codes from the code storage portion.

29. (Original) The encryption code management system of claim 26, wherein the electronic apparatus includes an erasure operation portion that erases from the code storage portion the encryption codes stored therein.

30. (Original) The encryption code management system of claim 26, wherein, in the result output portion of the data processors or the electronic apparatus, a plurality of the data processors among which the encryption codes are coincident and that thus build one communication system are displayed as one group.

31. (Original) The encryption code management system of claim 26,

wherein the electronic apparatus includes, one for each of the data processors with which the electronic apparatus has communicated, registration keys with which to register identification codes by which the data processors are identified, and

wherein the electronic apparatus stores in the code storage portion the encryption codes along with the identification codes registered with the registration keys.

32. (Original) The encryption code management system of claim 31, wherein, in the result output portion of the electronic apparatus or the data processors, the communication systems composed of a plurality of the data processors among which the encryption codes are coincident are indicated by displaying the identification codes thereof to indicate groups to which the plurality of data processors belong.

33. (Original) The encryption code management system of claim 31, wherein the identification codes are installation positions and types of the data processors.

34. (Original) The encryption code management system of claim 31, wherein the identification codes are device names of the data processors.

35. (Original) The encryption code management system of claim 26 wherein, when the encryption codes are exchanged, the encryption codes are exchanged along with device names of the data processors with which the encryption codes are associated.

36. (Original) The encryption code management system of claim 26, wherein the electronic apparatus is a remote control unit for operating the data processors.

37. (Original) The encryption code management system of claim 26, wherein the data exchanged between the data processors is AV data.

38. (Previously Presented) A data processor used as one of data processors that build a communication system employing the encryption code management system of claim 1.

39. (Previously Presented) An electronic apparatus used in the encryption code management system of claim 1.

40. (New) The encryption code management system of claim 1, wherein the electronic apparatus includes a display portion that display the comparison result.

41. (New) The encryption code management system of claim 1, wherein the comparison result includes identification of matching encryption codes.
